Phase 01 summery

Interviews revealed that users value simplicity, personalization, and tangible progress in wellness apps but face barriers like cost, trust, and inconsistent routines. Sleep emerged as a critical factor in mental wellness, with users seeking tools to manage and improve their sleep quality. Key features include personalized progress tracking, customizable soundscapes and themes, sleep management tools, reminders to build consistent habits, and gamified rewards for motivation. By offering intuitive, beginner-friendly guidance and addressing core needs like stress relief and sleep improvement, the app can build trust and encourage consistent use.

3 possible features

The diagram consists of three identical circular elements arranged horizontally. Each element is composed of two concentric circles. The inner circle is a solid orange color, and the outer ring is a lighter yellow-orange color. The text for each feature is centered within the orange inner circle.

which is; customizing
sound and noises]

Misha

Why Sleep Mood ?

The app needs a sleep mode because sleep is a cornerstone of mental wellness, directly impacting stress levels, mood, focus, and overall well-being. Many users struggle with falling asleep or maintaining a healthy sleep routine, which can exacerbate anxiety and hinder progress in mental health efforts.

Sleep Mood

Elevator Pitch

Our app is your ultimate companion for mental wellness, combining simplicity, personalization, and tangible progress. With tools like customizable soundscapes, sleep management features, and habit-building reminders, we tackle the barriers to consistent self-care. By focusing on stress relief and quality sleep, we empower users to improve their mental well-being with intuitive, beginner-friendly guidance—making wellness accessible, engaging, and rewarding.

1.

Relaxation Techniques:

Guided meditations, breathing exercises, or food and drinks to help users unwind before bed.

2.

Customizable Soundscapes:

Calming music or nature sounds tailored to individual preferences.

3.

bedtime stories:

enhances the app's appeal by offering calming, immersive experiences to help users relax and transition into sleep, with customizable options to suit diverse preferences.

Sleep Mood

★ potential users

Sarah downloads the app after reading about how sleep impacts mental wellness. She's intrigued by the idea of improving her productivity through better sleep but feels overwhelmed by where to start.

One night, after a particularly stressful day, she opens the app. The "**Sleep Mood**" feature catches her attention, offering a 5-minute guided *breathing exercise*. Feeling calmer, she decides to explore further and discovers a **personalized sleep routine** based on her bedtime habits.

Feeling intrigued, Sarah explores the "**Customize Your Sleep Sounds**" feature, which lets her mix her own relaxing playlist using binaural beats, rain sounds, and a soothing piano melody. She saves her favorite combination and schedules it to play automatically during her bedtime routine.

Over a week, Sarah uses **bedtime stories** to unwind, tracks her sleep, and notices her mood improving. Encouraged by the app's insights correlating her better sleep with fewer anxious mornings, Sarah becomes a consistent user, integrating both sleep and meditation tools into her nightly routine.

This scenario showcases how an app can cater to Sarah's need for simplicity, immediate relief, and long-term solutions for her mental and sleep wellness.

How might we integrate a feature that encourages users to get some fresh air?

upon reexamining the insights from the interviews we conducted, we found that most interviewees mentioned going outside as a method they used to reduce stress or anxiety. going for walks, runs, or hanging out at the beach were all mentioned. So, is there something here that we can work into a feature for headspace? We beleive there is, what we propose is a feature called fresh air mode.

Brainstorm

Summarized with AI - November 26, 2024

App enhancements for outdoor activities and mindfulness

Outdoor Walk Feature

- Includes a nature walk section with walking tracks or popular walks.
- Features a walking journal for recording thoughts and reflections.
- Offers a greenbelt/park locator to explore green spaces in the city.
- Homepage includes analytics like trip duration and completed walks.
- Considers using "wander" instead of "walk" for a more appealing label.

17 Calendar Integration

- Integrates a calendar for users to track their weekly schedule.
- Suggests mindfulness exercises based on busy times in the calendar.

Walking Journal

- Provides prompts for users to focus on during walks.
- Includes a response section for users to record feelings before and after exercises.

Walk Categorization

- Divides walks into categories like Stroll, Walk, Wander, and Adventure.
- Prompts users with things to focus on during different types of walks.

Community Activities

- Adds a community section with mindfulness-related activities.
- Potential downside: may divert users from core app features if they find external activities more beneficial.

Why Fresh Air ?

One of the best ways to alleviate stress, anxiety or depression is to get your body moving, breathe in some fresh air and change the scenery. Lots of people know this but many others do not. Having a fresh air feature that encourages users to go for a quick stroll, walk, or even just outside for some fresh air would be a great feature for headspace.

Fresh air mode

Elevator Pitch

I really enjoy headspace and the various features make it super accessible to all kinds of people. But, I have identified an opportunity that could not only draw in more potential users but also offer current users a whole new category of mindfulness. Within multiple qualitative interviews I've conducted, getting outside was mentioned as one main way to relieve stress. What I propose isn't just some daily step counter but a personalized approach that will encourage all types of users to simply change their scenery or get the blood flowing. It is a quick and easy way for users to see immediate positive results. I would love to run you through the details sometime soon, I think this has the potential to be quite a beneficial feature for headspace.

1.

Stroll, Walk, Wander, Adventure:

options for different kinds of walks. Stroll being 10-15mins, walk 15-30mins, Wander 30+ mins, Adventure 1 hour+. The idea behind this language is to remind users that they don't have to dedicate lots of time to get the benefits of being outside

2.

Walk journal:

A section for users to input thoughts, ideas, epiphanies, philosophies, anything that comes to mind on the walk. this feature will be accessible when in fresh air mode but will also prompt the user after completing a walk

3.

O₂ for you:

this section is a statistical section for users to get a sense of how much they are walking or spending time outside. it is meant as more of a reminder to get outside rather than progress tracking. users can then tell when fresh air or walking has had an impact on their mindfulness

★ potential users

Darrell is new to headspace and is exploring headspace looking at all the different features offered to him. Darrell has joined headspace to reduce stress and become more productive. Darrell has noticed that at work he is productive in the early morning but loses motivation in the late morning. he is looking for a way to increase his productivity which in turn will decrease work related stress. when browsing the various features the fresh air mode catches his eye. He decides to try a quick stroll to see how effective it is. while on the stroll darrell has time to think over the rest of his work day. he visualizes each task for the day and returns to work with a better idea of how to attack the work hes been assigned. Inspired by the success or the quick stroll he decides to incorporate more time for walks into his schedule. he starts to record some of his ideas in the walk journal and creates a bank of ideas that he can access at work so that he is rarely stumped by creative blocks. Darrell realizes that he has felt a lot more relaxed at work since using the fresh air mode on headspace, he is happy that he has found a fast acting solution to his problem. Darrell is satisfied.

Fresh air Mode

How do we can add more features in the AI feature of Headspace?

We discovered that the AI feature doesn't include other features that can offer personalized meditation recommendations based on user preferences and mood. After re-examining the insights from the interviews,

★ **Why an
AI Feature?**

People might seek an AI
feature in the Headspace app
for a variety of reasons,
primarily to enhance the user
experience and offer more
personalized and efficient
tools for mental well-being.

AI feature

Elevator Pitch

Imagine a meditation app that truly understands you — not just your preferences, but your mood, goals, and needs in real-time. With AI-powered personalized recommendations, Headspace adapts to your emotional state, whether you're feeling stressed, distracted, or ready for sleep. By analyzing your mood, past sessions, and even health data from wearables, it delivers tailored meditation sessions that are perfect for where you are, not just who you are. And as you progress, the AI learns from your feedback, offering increasingly accurate guidance to help you stay on track with your mindfulness journey. Whether you're new to meditation or a seasoned practitioner, Headspace's AI brings you a truly personalized, dynamic meditation experience — guiding you to be more present, more focused, and more relaxed, every day.

1.

AI – generated Motivational Quotes

Integrating AI-generated motivational quotes into the Headspace app can enhance the user experience. It can tailor quotes to individual moods, challenges, and progress, ensuring that users receive messages that resonate with their current state. AI can also adapt quotes to real-time events or user activity, reinforcing positive thought patterns.

2.

Voice Activation

Incorporating voice activation into the Headspace app, allowing users to talk with AI instead of just chatting through text, could foster a deeper sense of connection and engagement. Speaking out loud to the app, rather than typing, makes the interaction feel more natural and human, which could help users feel more heard and understood.

3.

Real-time Mood Boosting

AI could offer real-time mood-boosting prompts or content based on environmental factors. For example, if the app detects the user is in a noisy or high-stress environment (via location or real-time data), it could suggest immediate actions like taking a mindful pause, practicing breathing exercises, or listening to calming music to help lower stress.

★ potential users

Emma often juggles the stress of exams, social pressures, and finding a balance between school and personal life. With a busy schedule, she finds it hard to commit to a regular self-care routine, especially when it comes to mental health. The AI feature in the Headspace app helps her by offering personalized meditation and mindfulness exercises that fit into her hectic day. Whether she's feeling anxious before a big test or overwhelmed by a heavy workload, the AI tracks her mood and recommends short, targeted sessions—like deep breathing or a quick mindfulness break—to help her regain focus and calm. It even provides insights into her progress over time, encouraging her to stay consistent while adapting to her evolving needs. With the app's AI, Emma feels supported, even when life gets chaotic, and is able to prioritize her mental well-being in a way that feels manageable and tailored to her unique lifestyle.
